5. Project conclusion: **12**

1. Project Description:

1.1. Introduction and purpose of the eDIS admin:

- The eDIS Admin is the internal tool used to monitor, access, verify and approve electronic Delivery Instruction Slip (eDIS) requests for On Market, Off Market and Unpledge transactions. It gives the checker one place to review entries coming from JPLUS/COMET, decide on each one (accept, hold or reject, with a reason), and prepare the approved entries for upload to the CDSL admin portal.

2. Scope and Requirement:

2.1. Scope Details (Short details of the requirement):

- **Checker Dashboard.** Verifies and approves eDIS requests for the On Market, Off Market and Unpledge modules. The work includes both UI integration and backend development. It covers:
  - receiving entries from JPLUS/COMET in an unapproved state (pending state);
  - searching and filtering by status and day;
  - accept, hold and reject actions, with reasons, for single and bulk entries;
  - editing entries;
  - exporting entries to Excel for verification.
- **Report Dashboard.** Holds the accepted entries and exports them in CDSL format. It has two sections:
  - **Non-Exported:** accepted entries not yet downloaded. Each eDIS type has its own CDSL format.
  - **Exported:** entries already downloaded, kept for reference.
- Entries that are on hold or rejected never appear here.
- **Logs Management.** Records the activity performed in the admin so actions can be traced.

2.2. Definitions and abbreviations:

Term	Meaning
eDIS	Electronic Delivery Instruction Slip
CDSL	Central Depository Services (India) Limited
BOID	Beneficial Owner ID of the client
CTR BOID	Counterparty BOID
CMID / TMID / EXID	Clearing Member ID / Trading Member ID / Exchange ID
RES ID / Txn ResID	Response ID/transaction response ID
ISIN	International Securities Identification Number

2.3. Process flow overview:

Step	Activity
1	Client eDIS entry is created in JPLUS / COMET and arrives in the Checker Dashboard in Pending state.
2	The checker verifies the entry and chooses Accept, Hold or Reject (with reason).
3	Accepted entries move to the Report Dashboard, Non-Exported section.
4	The user downloads the CDSL-format file for the selected eDIS type.
5	Downloaded entries move to the Exported section.
6	The user uploads the downloaded file to the CDSL admin portal.

2.4. Requirements:

2.4.1. Checker Dashboard:

The Checker Dashboard contains three modules (On Market, Off Market and Unpledge) for verifying and approving eDIS requests. The three modules behave identically except where stated.

1. Common UI elements:

Element	Specification
eDIS type selector	On Market, Off Market, Unpledge
Date range	Format DD-MM-YYYY (To - From)
Status filters	Pending, Under Verification, Hold, Rejected, Failed, Accepted
Day filters	Today, <7 days, <15 days, <30 days, This year, Last year, Custom Date
Row-level options	Edit, Reason, Download, Video Upload
Grid fields	Client Code, Client Name, BOID, CTR BOID, Action Date, CMID, TMID, EXID, RES ID, Transaction Type (plus Ledger Balance in Unpledge)

2. Verification and approval workflow:

Points	Requirement
1.	Entries created through JPLUS / COMET shall be received in the eDIS Admin under the corresponding eDIS type (On Market, Off Market, Unpledge).
2.	Every new entry shall initially be in an unapproved state (Pending) until the admin acts on it.

3.	Each entry shall display all primary details together with the scrip information (scrip name, ISIN, quantity, valuation).
4.	The admin shall thoroughly verify each entry and take one of three actions: Accept, Hold or Reject.
5.	Hold and Reject shall each open a separate screen in which the admin records the appropriate reason. A reason shall be mandatory for both actions.
6.	When the admin accepts an entry, the entry shall move to the Report Dashboard, where all accepted entries are compiled in CDSL format.
7.	Entries in Hold or Rejected status shall never be included in the Report Dashboard.

3. Search, filter, export and bulk actions:

ID	Requirement
1.	Search shall work only on Client Code, BOID and Script Name.
2.	The list shall be sorted with the latest entries first (descending order by date/time).
3.	An Export button shall allow the admin to download all entries in Excel format for verification.
4.	The exported file shall reflect the Day Filter selected (All, Today, Yesterday, <7 days, <15 days, <30 days).
5.	Status filters and Day filters shall work together at the same time.
6.	The total number of applications/entries for the current selection shall be displayed.
7.	The admin shall be able to Accept, Hold or Reject multiple entries in bulk.
8.	Bulk Edit shall be available for selected entries.

4. On Market Module:

- The On Market module allows the checker to verify and approve on-market eDIS requests received from JPLUS / COMET.

List screen:

- **Buttons:** Accept, Hold, Reject (when the entries selected by the user).
- **Search bar:** Client Code, BOID, Scrip Name only.
- Bulk Edit and Edit options.
- **Grid columns:** Client Code, Client Name, BOID, CTR BOID, Action Date, CMID, TMID, EXID, RES ID, Transaction Type.
- **Edit screen:** opens the detail view.

Logics:

- Initially, the entries will be filtered by the Pending stage using the Today filter.
- All entry selection checkboxes will remain unchecked by default.
- When the user selects one or more entries using the checkboxes, the Accept, Hold, and Reject options will become visible.
- When the user clicks directly on the Reason field in the entry grid, the reason form will open with the corresponding entry selected. The user can then select the appropriate Hold or Reject reason.
- When the user selects all entries and clicks Accept, the accepted entries will disappear from the Checker Dashboard and be transferred to the Report Dashboard (Non-Exported menu).
- When the user clicks the Edit option, the primary details and script information will open, with the Accept, Hold, and Reject actions available. The user can perform the appropriate action based on the entry details.
- Only accepted entries will be transferred to the Report Dashboard (Non-Exported menu).
- Hold and rejected entries will remain in the Checker Dashboard report.
- Whatever reason the user entered in the admin, the same reason should be reflected in the JPLUS/COMET transaction history.

5. Off Market Module:

- The Off Market module allows the checker to verify and approve off-market eDIS requests received from JPLUS / COMET.

List screen:

- **Buttons:** Accept, Hold, Reject.
- **Search bar:** Client Code, BOID, Scrip Name only.
- Bulk Edit and Edit options.
- **Grid columns:** Client Code, Client Name, BOID, CTR BOID, Action Date, CMID, TMID, EXID, RES ID, Transaction Type.
- **Edit screen:** opens the detail view

Logics:

- Initially, the entries will be filtered by the Pending stage using the Today filter.
- All entry selection checkboxes will remain unchecked by default.
- When the user selects one or more entries using the checkboxes, the Accept, Hold, and Reject options will become visible.
- When the user clicks directly on the Reason field in the entry grid, the reason form will open with the corresponding entry selected. The user can then select the appropriate Hold or Reject reason.
- When the user selects all entries and clicks Accept, the accepted entries will disappear from the Checker Dashboard and be transferred to the Report Dashboard (Non-Exported menu).
- When the user clicks the Edit option, the primary details and script information will open, with the Accept, Hold, and Reject actions available. The user can perform the appropriate action based on the entry details.
- Only accepted entries will be transferred to the Report Dashboard (Non-Exported menu).
- Hold and rejected entries will remain in the Checker Dashboard report.
- If the IPV video is not available, then show – in the action column.

- On hover of the download icon, show “Download IPV video shot by the user”
- If the user has recorded an IPV video and an IPV number has been generated, clicking on the Reason button should display the generated IPV number in the reason box.
- When the user clicks the Resend IPV Link option on the Detail Information page, an SMS containing the IPV link should be sent to the user’s registered mobile number.
- Whatever reason the user entered in the admin, the same reason should be reflected in the JPLUS/COMET transaction history.

6. Unpledge Module:

- The Unpledge module allows the checker to verify and approve unpledge eDIS requests received from JPLUS / COMET.

List screen:

- **Buttons:** Accept, Hold, Reject.
- **Search bar:** Client Code, BOID, Script Name only.
- Bulk Edit and Edit options.
- **Grid columns:** Client Code, Client Name, BOID, CTR BOID, Action Date, CMID, TMID, EXID, RES ID, Transaction Type, Ledger Balance.
- **Edit screen:** opens the detail view.

> **Note:** Ledger Balance is shown only in the Unpledge module, so the checker can confirm the client's position before approving.

Logics:

- Initially, the entries will be filtered by the Pending stage using the Today filter.
- All entry selection checkboxes will remain unchecked by default.
- When the user selects one or more entries using the checkboxes, the Accept, Hold, and Reject options will become visible.
- When the user clicks directly on the Reason field in the entry grid, the reason form will open with the corresponding entry selected. The user can then select the appropriate Hold or Reject reason.

- When the user selects all entries and clicks Accept, the accepted entries will disappear from the Checker Dashboard and be transferred to the Report Dashboard (Non-Exported menu).
- When the user clicks the Edit option, the primary details and script information will open, with the Accept, Hold, and Reject actions available. The user can perform the appropriate action based on the entry details.
- Only accepted entries will be transferred to the Report Dashboard (Non-Exported menu).
- Hold and rejected entries will remain in the Checker Dashboard report.

7. Edit (detail) screen

- Clicking Edit on an entry opens a detail screen with the following fields and controls:

Fields	Controls
Client Name Client Code Request Date Execution Date Settle ID Scrip Name ISIN QTY Valuation Status Txn ResID	Accept button Hold button Reject button Reason box Resend IPV link (in case of off market transaction)

- The same layout applies to On Market, Off Market and Unpledge.

8. Hold and Reject screen

- Clicking Hold or Reject opens a separate screen.

- The admin enters the reason for the action and confirms.
- The reason is saved against the entry and can be viewed later through the Reason option on the list. The reason should be reflected in client history (JPLUS).

9. Bulk actions

- The admin selects multiple entries and chooses Accept, Hold or Reject for all of them.
- Bulk Hold and Bulk Reject also require a reason.
- Bulk Edit applies to the selected entries.

10. Entry status lifecycle

Status	Meaning (proposed)	In Report Dashboard?
Pending	Received from JPLUS / COMET, not yet acted on	No
Under Verification	Opened by a checker and being verified	No
Hold	Parked by the checker with a reason	No
Rejected	Rejected by the checker with a reason	No
Failed	Processing of the entry failed	No
Accepted	Approved by the checker	Yes

2.4.2. Report Dashboard:

The Report Dashboard holds accepted eDIS entries and lets the user download them in CDSL format, ready to upload to the CDSL admin portal. It has two sections:

- **Non-Exported:** accepted entries not yet downloaded. Downloading produces the Excel file in CDSL format.
- **Exported:** entries that have already been downloaded, so the user can see which scrips were exported for the selected eDIS type.

1. Common UI (both sections):

Element	Specification
eDIS type selector	On Market, Off Market, Unpledge
Date range	Format DD-MM-YYYY (To - From)
Day filters	All, Today, Yesterday, <7 days, <15 days, <30 days
Search	Client Code, Scrip Name, BOID
Total applications	Count of entries for the selected eDIS type and filters

2. Grid columns (all three eDIS types, both sections):

#	Column
1	Request Time
2	BOID
3	Client Code
4	ISIN
5	Scrip Name
6	Quantity
7	Amount

3. Non-Exported section:

ID	Requirement
1.	Shows only entries accepted in the Checker Dashboard that have not yet been downloaded.
2.	Each eDIS type (On Market, Off Market, Unpledge) has its own CDSL format. The file downloaded shall match the eDIS type selected.
3.	The download is an Excel file in the CDSL format for the selected eDIS type.
4.	After download, the entries move to the Exported section for that eDIS type.
5.	Day filters, date range and search shall return entries that match the selection, and the downloaded file shall contain the same selection.
6.	The total application count shall update with the selected eDIS type and filters.

4. Exported section:

ID	Requirement
1.	Lists all entries previously downloaded, grouped by the selected eDIS type.
2.	Supports the same date range, day filters, search and total count as the Non-Exported section.
3.	Entries in this section are for reference; they are not downloaded again as new entries.

2.4.3. Logs management:

1. Main grids:

#	Grid Column
1	Client Code
2	Client Name
3	Broker Code
4	Branch Code
5	Transaction Type
6	Request Time
7	Script ISIN
8	Script Name
9	Transaction Quantity
10	Transaction Amount

11	BOID
12	CtrBOID
13	Status
14	TxnResID
15	SettleID
16	USN
17	TrRsnCode
18	Payment Mode
19	TrRsnCodeChild
20	Bank Account No.
21	Bank Name
22	Branch Name

23	Transfer Name
24	Date of Issue/Transfer
25	Reference No.
26	Cheque No.
27	Amount
28	Entry By (Client, Broker, Branch, UID, Admin)
29	Entry Source

Logics:

- Show the logs by default of 7 days.
- The filtering should be done by transaction type and status.
- The status should be updated based on the latest status received from the Checker Dashboard. If the checker accepts, holds, or rejects an entry, the status should be updated accordingly to reflect the latest action taken.
- Common functionality: searchbar, filter and export CTA.

3. Stakeholders

3.1. Stakeholder's Details:

- The essential stakeholders involved in this project include the Jainam Broking Ltd team, including Brijal Pachchigar, Nemil Shah, Kartik Balsara, the DP team, the compliance team and the team's tech engineering.

4. Delivery Date:

4.1. Delivery Detail and Date

The expected delivery date will be **ASAP**.

5. Project conclusion:

- The eDIS Admin gives the checker a single, controlled place to verify and approve eDIS requests for On Market, Off Market and Unpledge transactions. Entries from JPLUS and COMET arrive in an unapproved state and are reviewed one by one or in bulk. Each is accepted, held or rejected, and every hold or rejection carries a recorded reason. Only accepted entries move to the Report Dashboard, where they are downloaded in the CDSL format for their eDIS type and then listed under Exported. Held and rejected entries stay out of the reports, so the files uploaded to the CDSL admin portal contain only approved entries. Search, status and day filters, sorting, Excel export, entry counts and bulk actions are consistent across all three modules. Logs management supports traceability of the actions taken. Together these requirements reduce manual checking, lower the risk of incorrect submissions to CDSL, and give the team a clear record of what was approved, held, rejected and exported.
